## Customizable Multi-Carrier Shipping Technology

ConnectShip | iShip Warehouse is a multi-carrier, multi-modal, and highly customizable client/server shipping management application. It enables numerous shipping functions such as: maintaining global customer address lists, comparing a wide variety of carrier shipping services, printing carrier-compliant shipping labels, producing manifest reports, and performing electronic end-of-day procedures. It has scripting capabilities that allow you to enforce business rules and integrate with other systems. It combines convenient browser-based administration and centralized configuration management functions with a full-featured shipping application. It provides access to the latest information from major carriers using our carrier components, where all the service guides, regulations, rate charts, routing tables, delivery commitments, and documents are maintained.

Designed as a client/server system, ConnectShip | iShip Warehouse allows administrators in your company to remotely configure servers and individual workstations from one centralized location across the network. New workstations can be brought online by downloading and installing the client shipping application from a browser--eliminating the need for your systems administrator to physically go on site and set up each machine.
